Deep Learning

XOR-Problem

Learning goals

 Example problem a single neuron can not solve but a single hidden layer net can

Suppose we have four data points

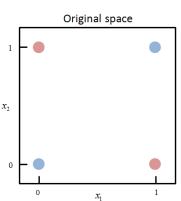

$$X = \{(0,0)^{\top}, (0,1)^{\top}, (1,0)^{\top}, (1,1)^{\top}\}\$$

 The XOR gate (exclusive or) returns true, when an odd number of inputs are true:

<i>X</i> ₁	<i>X</i> ₂	XOR = y
0	0	0
0	1	1
1	0	1
1	1	0

• Can you learn the target function with a logistic regression model?

- Logistic regression can not solve this problem. In fact, any model using simple hyperplanes for separation can not (including a single neuron).
- A small neural net can easily solve the problem by transforming the space!

Consider the following model:

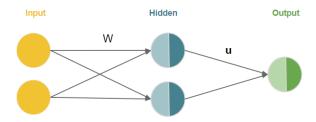

Figure: A neural network with two neurons in the hidden layer. The matrix \mathbf{W} describes the mapping from \mathbf{x} to \mathbf{z} . The vector \mathbf{u} from \mathbf{z} to \mathbf{y} .

• Let use ReLU $\sigma(z) = \max\{0,z\}$ as activation function and a simple thresholding function $\tau(z) = [z>0] = \begin{cases} 1 & \text{if } z>0 \\ 0 & \text{otherwise} \end{cases}$ as output transformation function. We can represent the architecture of the model by the following equation:

$$f(\mathbf{x} \mid \boldsymbol{\theta}) = f(\mathbf{x} \mid \mathbf{W}, \mathbf{b}, \mathbf{u}, c) = \tau \left(\mathbf{u}^{\top} \sigma(\mathbf{W}^{\top} \mathbf{x} + \mathbf{b}) + c \right)$$
$$= \tau \left(\mathbf{u}^{\top} \max\{0, \mathbf{W}^{\top} \mathbf{x} + \mathbf{b}\} + c \right)$$

- So how many parameters does our model have?
 - In a fully connected neural net, the number of connections between the nodes equals our parameters:

$$\underbrace{(2\times2)}_{W} + \underbrace{(2\times1)}_{h} + \underbrace{(2\times1)}_{U} + \underbrace{(1)}_{C} = 9$$

Let
$$\mathbf{W} = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$$
, $\mathbf{b} = \begin{pmatrix} 0 \\ -1 \end{pmatrix}$, $\mathbf{u} = \begin{pmatrix} 1 \\ -2 \end{pmatrix}$, $c = -0.5$

$$\mathbf{X} = \begin{pmatrix} 0 & 0 \\ 0 & 1 \\ 1 & 0 \\ 1 & 1 \end{pmatrix}, \ \mathbf{XW} = \begin{pmatrix} 0 & 0 \\ 1 & 1 \\ 1 & 1 \\ 2 & 2 \end{pmatrix}, \ \mathbf{XW} + \mathbf{B} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \\ 1 & 0 \\ 2 & 1 \end{pmatrix}$$

Note: **X** is a $(n \times p)$ design matrix in which the *rows* correspond to the data points. **W**, as usual, is a $(p \times m)$ matrix where each *column* corresponds to a single (hidden) neuron. **B** is a $(n \times m)$ matrix with **b** duplicated along the rows.

$$X = \begin{pmatrix} 0 & 0 \\ 0 & 1 \\ 1 & 0 \\ 1 & 1 \end{pmatrix} \qquad W = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$$

Let
$$\mathbf{W} = \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$$
, $\mathbf{b} = \begin{pmatrix} 0 \\ -1 \end{pmatrix}$, $\mathbf{u} = \begin{pmatrix} 1 \\ -2 \end{pmatrix}$, $c = -0.5$

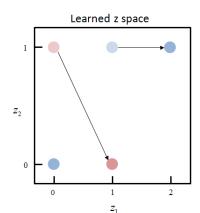

$$\mathbf{X} = \begin{pmatrix} 0 & 0 \\ 0 & 1 \\ 1 & 0 \\ 1 & 1 \end{pmatrix}, \ \mathbf{XW} = \begin{pmatrix} 0 & 0 \\ 1 & 1 \\ 1 & 1 \\ 2 & 2 \end{pmatrix}, \ \mathbf{XW} + \mathbf{B} = \begin{pmatrix} 0 & -1 \\ 1 & 0 \\ 1 & 0 \\ 2 & 1 \end{pmatrix}$$

$$Z = \max\{0, XW + B\} = \begin{pmatrix} 0 & 0 \\ 1 & 0 \\ 1 & 0 \\ 2 & 1 \end{pmatrix}$$

Note that we computed all examples at once.

 The input points are mapped into transformed space to

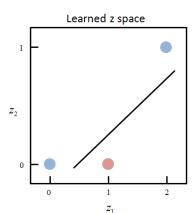

$$\mathbf{Z} = egin{pmatrix} 0 & 0 \ 1 & 0 \ 1 & 0 \ 2 & 1 \end{pmatrix}$$

 The input points are mapped into transformed space to

$$oldsymbol{Z} = egin{pmatrix} 0 & 0 \ 1 & 0 \ 1 & 0 \ 2 & 1 \end{pmatrix}$$

which is easily separable.

In a final step we have to multiply the activated values of matrix Z
with the vector u and add the bias term c:

$$f(\mathbf{x} \mid \mathbf{W}, \mathbf{b}, \mathbf{u}, c) = \begin{pmatrix} 0 & 0 \\ 1 & 0 \\ 1 & 0 \\ 2 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ -2 \end{pmatrix} + \begin{pmatrix} -0.5 \\ -0.5 \\ -0.5 \\ -0.5 \end{pmatrix} = \begin{pmatrix} -0.5 \\ 0.5 \\ 0.5 \\ -0.5 \end{pmatrix}$$

• And then apply the step function $\tau(z) = [z > 0]$. This solves the XOR problem perfectly!

<i>x</i> ₁	<i>X</i> ₂	XOR = y
0	0	0
0	1	1
1	0	1
1	1	0

NEURAL NETWORKS: OPTIMIZATION

- In this simple example we actually "guessed" the values of the parameters for W, b, u and c.
- That won't work for more sophisticated problems!
- We will learn later about iterative optimization algorithms for automatically adapting weights and biases.
- An added complication is that the loss function is no longer convex. Therefore, there might not exist a single minimum.
